

hi i strongly believe that shooting after dark will provide a huge impact to the number of foxes and rabbits. as rabbits and foxes are evidently more active between sunset and 3am. i believe this is practical only if low powered rifle cartridges such as .22 22hmr .17 and air rifles. these are more quiet than big bore rifles like .30 and the projectiles don't travel as far. also letting law abiding hunters shoot in national parks and some crown land under a tag system would be great way to bring the deer fox and rabbit population down. while encouraging more outdoor sports such as rec hunting we are attacking the obesity epidemic with a fun and safe way of getting people outdoors. which also reduces mental illness. also people knowing that there going to bag foxes and rabbits (because there is more of a chance of getting rabbits and foxes at night) they are more likely going to go hunting, which also provides a boost to our rural towns economy's as hunters are going to stop off in town to buy supplies. thank you for reading
